GridTracker v1.22.0903
An Amateur Radio Companion

Sept 3rd, 2022

General Information

Happy Labor Day weekend to all US Amateurs and hope everyone in the northern hemisphere is enjoying some of the cooler weather and the southern hemisphere some warmer weather to get out and activate some POTA or SOTA.

Over the last month we were able to fix a few things that had not been working for various reason and some small stuff that was discovered to have broke during the Call Roster refactoring. Some of the major fixes were DXCC CQ and and Statistics CQ highlighting and Award Tracker not overriding and hiding the Wanted checkboxes. There is also now fixed lightening display and alerts.

We welcome new developers, especially those with a background in JavaScript WebKit development to join us. Any user code contribution is also welcome as well.

As always if you find any bugs or have any suggestions or comments, We welcome those in our Groups.IO and Discord channels.

Changelog

- Fixed a bug that displayed 1.25m band QSOs incorrectly.
- Fixed broken DXCC CQ highlighting and Statistics CQ highlighting.
- Fixed an exception that occurs when the OAMS server is restarting.
- Resolved #159 where the Wade Hampton Census area should be the Kusilvak Census Area.
- Fixed where using the Award Tracker didn't override and hide the Wanted select of the call roster. This was the behavior prior to the call roster refactor.
- Fix lightening strike display/alerts, this data now flows through OAMS rather then trying to poll direct from Blitzkrieg.
